

DAX_measures

- [DAX Measures — Copy-Paste Ready](#)

DAX Measures — Copy-Paste Ready

Real Estate AI Decision Intelligence Platform — Power BI Build Kit

How to use: In Power BI Desktop, right-click the relevant table in the Fields pane → “New measure” → paste the DAX below → Enter.

PAGE 1 — EXECUTIVE
OVERVIEW (table: mart_01_portfolio_kpis)

- % of properties fully evaluated (data coverage KPI) Pct Fully Evaluated = DIVIDE(
SUM(mart_01_portfolio_kpis[properties_with_full_decision_evaluation]),
SUM(mart_01_portfolio_kpis[total_properties_in_platform])) * 100

- % INVEST rate among evaluated properties Pct Invest Rate = DIVIDE(
SUM(mart_01_portfolio_kpis[decision_invest_count]),
SUM(mart_01_portfolio_kpis[properties_with_full_decision_evaluation])) * 100

Note: for the decision distribution donut chart, use the separate reshaped file
`mart_01b_decision_distribution.csv` (decision, count, pct columns) instead of writing DAX to unpivot the
wide mart_01 columns - it's already in the right shape to drag straight into a donut/pie chart (Legend =
decision, Values = count).

PAGE 2 — MARKET &
LOCALITY INTELLIGENCE (table: mart_02_market_locality)

- Demand/Supply ratio (not precomputed in the mart - derive here) Demand Supply Ratio = DIVIDE(
SUM(mart_02_market_locality[latest_demand_index]), SUM(mart_02_market_locality[latest_supply_index])
)

- Conditional formatting measure: growth direction color - (bind this to Conditional Formatting > Font
Color on yoy_price_growth_pct) Growth Color = IF(
SELECTEDVALUE(mart_02_market_locality[yoy_price_growth_pct]) >= 0, “#4FAE84”, - pos green
“#D9695C” - neg red)

PAGE 3 — PROPERTY &
INVESTMENT ANALYSIS (table: mart_03_property_investment)

- Valuation gap direction label (underpriced / overpriced / fair) Valuation Gap Label = VAR gap =
SELECTEDVALUE(mart_03_property_investment[valuation_gap_pct]) RETURN SWITCH(TRUE(), gap > 5,
“Underpriced (model > asking)”, gap < -5, “Overpriced (model < asking)”, “Fairly priced”)

- Conditional formatting color for the valuation gap bar chart Valuation Gap Color = VAR gap =
SELECTEDVALUE(mart_03_property_investment[valuation_gap_pct]) RETURN IF(gap >= 0, “#4FAE84”,
“#D9695C”)

- Count of properties by decision (for the slicer summary card) Property Count =
COUNTROWS(mart_03_property_investment)

PAGE 4 — FINANCIAL &
RISK INTELLIGENCE (tables: mart_04_financial_risk, mart_04c_scenarios_extended4)

- IRR as a whole percentage for card display (source is a decimal, e.g. 0.1785) IRR Pct = $\text{AVERAGE}(\text{mart_04_financial_risk}[\text{irr}]) * 100$
- ROI as a percentage (source is a ratio, e.g. 1.2377 = 123.77%) ROI Pct = $\text{AVERAGE}(\text{mart_04_financial_risk}[\text{roi_total_holding_period}]) * 100$
- Probability of negative NPV as a whole percentage Prob Negative NPV Pct = $\text{AVERAGE}(\text{mart_04_financial_risk}[\text{probability_negative_npv}]) * 100$
- Average DSCR (some rows may be blank/N-A if no financing data - AVERAGE ignores blanks automatically) Avg DSCR = $\text{AVERAGE}(\text{mart_04_financial_risk}[\text{dscr}])$
- Scenario spread label for the tornado/waterfall chart ordering - (add a calculated column, not a measure, on mart_04c_scenarios_extended4) Scenario Order = $\text{SWITCH}(\text{mart_04c_scenarios_extended4}[\text{scenario}], \text{"Severe Downside"}, 1, \text{"Downside"}, 2, \text{"Base"}, 3, \text{"Upside"}, 4, 5)$
- After adding this column: right-click "scenario" column > Sort by Column > Scenario Order - so the X-axis reads Severe Downside -> Downside -> Base -> Upside left to right.

PAGE 5 — GEO

INTELLIGENCE (table: mart_05_geo)

- Count of localities with INSUFFICIENT DATA flood risk (for an honesty callout card) Localities Missing Flood Data = $\text{CALCULATE}(\text{COUNTROWS}(\text{mart_05_geo}), \text{mart_05_geo}[\text{flood_risk_status}] = \text{"INSUFFICIENT DATA"})$
- % of portfolio with missing flood/environmental data Pct Missing Flood Data = $\text{DIVIDE}([\text{Localities Missing Flood Data}], \text{COUNTROWS}(\text{mart_05_geo})) * 100$

PAGE 6 — DECISION

INTELLIGENCE (tables: mart_06_decision_summary, mart_06b_decision_components, mart_06c_decision_gates, mart_06d_decision_reasons)

- Decision badge color (for conditional formatting on the decision column/matrix) Decision Color = $\text{SWITCH}(\text{SELECTEDVALUE}(\text{mart_06_decision_summary}[\text{decision}]), \text{"INVEST"}, \text{"#4FAE84"}, \text{"HOLD"}, \text{"#D9A85C"}, \text{"AVOID"}, \text{"#D9695C"}, \text{"INSUFFICIENT"}, \text{"#5D6B7C"}, \text{"#5D6B7C"})$
- Gate pass rate (for the critical-gates page, mart_06c) Gate Pass Rate = $\text{DIVIDE}(\text{CALCULATE}(\text{COUNTROWS}(\text{mart_06c_decision_gates}), \text{mart_06c_decision_gates}[\text{passed}] = \text{TRUE}), \text{COUNTROWS}(\text{mart_06c_decision_gates})) * 100$
- Average component score per component (for the stacked/radar chart, mart_06b) Avg Component Score = $\text{AVERAGE}(\text{mart_06b_decision_components}[\text{score}])$

PAGE 7 — DATA QUALITY

& MONITORING (table: mart_07_data_quality)

- Count of REJECTED models (this is the number worth highlighting in - an interview - it proves governance, not just that models exist) Rejected Model Count = $\text{CALCULATE}(\text{COUNTROWS}(\text{mart_07_data_quality}), \text{mart_07_data_quality}[\text{status}] = \text{"REJECTED"})$
- Status color for the data-quality status column Status Color = $\text{SWITCH}(\text{SELECTEDVALUE}(\text{mart_07_data_quality}[\text{status}]), \text{"PASS"}, \text{"#4FAE84"}, \text{"PASS WITH LIMITATIONS"}, \text{"#D9A85C"}, \text{"CONDITIONAL"}, \text{"#D9A85C"}, \text{"REJECTED"}, \text{"#D9695C"}, \text{"UNCALIBRATED"}, \text{"#5B9BD9"}, \text{"INSUFFICIENT DATA"}, \text{"#5D6B7C"}, \text{"#5D6B7C"})$
